91. Playing records	94
92. Reading a newspaper/magazine	95
93. Using a cassette player	96
94. Using a VCR	97
95. Using a Viewmaster	98
96. Watching T.V.	99
97. Calling friends on the telephone	100
98. Going out dancing	101
99. Receiving telephone calls	102
100. Sunbathing	103
101. Using a whirlpool/hot tub	104
102. Visiting family/friends	105
103. Golfing	106
104. Skiing	107

INTRODUCTION: THE TASK ANALYSIS DATA SHEET

The task analysis data sheet (TADS) is the data sheet that is used most frequently by teachers in the LRE for LIFE Project to monitor student progress toward IEP goals. It is intended to be a permanent record not only of the student's progress toward goals but also the teacher's attempt(s) at addressing the IEP goals. The beauty of the TADS rests with its design which accounts for elements considered most essential to the development of sound, effective instructional programs. These elements are described below.

1. **Name** refers to the student's name. **Annual Goal** refers to the IEP goal being addressed. (Refer to A on Figure 1).
2. **Step/Behavior** refers to the steps of a task analysis. A task analysis is the sequential breakdown of the task or the activity into its component steps. (Refer to B on Figure 1). In completing a task analysis, it is important that the sequential breakdown of the component steps are the actual steps in the task and that the teacher does not interject unnecessary steps. Each step of the task analysis should be defined specifically in terms of quality, quantity, and latency of response such that correct and error responses are clearly delineated. This will result in clear and consistent expectations of the student and reliable data collection between recorders over time.
3. **Natural Cue(s)** refers to naturally occurring stimuli that elicit the desired activity or skill. For example, the alarm clock ringing is the natural cue for many people to get out of bed and get ready to go to school or work. (Refer to C on Figure 1.)
4. **Natural Consequences** are the events occurring naturally after the student's performance or attempted performance of the activity or skill. For example, eating a candy bar is the natural consequence for using a vending machine correctly. A door not opening is the natural consequence for pushing the door to open when it is supposed to be pulled. (Refer to D on Figure2).
5. **Teaching Strategy**. The LRE for LIFE Project supports the practice of allowing individual student performance to guide the selection and delivery of specific teaching strategies. Specific teaching strategies and changes in strategies are noted on the TADS above the raw data corresponding to the date on which the strategy was initiated or changed. The strategies should include should include the major teaching approach (i.e., trial & error or errorless learning) and the chaining strategy used. If a trial & error teaching approach is used, the specific error correction procedure should be noted (i.e., standard error correction procedure, repeated practice, or system of least prompts). If an errorless learning approach is used, the specific prompt/fade procedure should be noted (i.e., constant time delay, progressive time delay, decreasing prompt hierarchy, fading of multiple prompts). (Refer to E on Figure 1).
6. **Date**. It is important that teachers document each date on which the instruction was delivered. (Refer to F on Figure 1). It is important not only to note the specific date of instruction but also to ensure that the student has sufficient opportunity to learn the task or activity across time. The ability to keep track of the opportunities that the student has to learn a task or activity over time is accounted for on the TADS in the date section. Note that there are thirty date spaces. This is to correspond to six weeks of data where the first space refers to Monday of the first week, the second space to Tuesday of the first week, onward to the

thirtieth space which refers to Friday of the sixth week. Each week is separated by a solid line. Teachers are encouraged to mark the data in the appropriate Monday through Friday date spaces rather than marking nonconsecutive days of data next to each other. In this way, a visual display of actual opportunities to learn across time becomes obvious to the eye. If the student is not learning, the teacher should consider whether s(he) is receiving sufficient opportunities to learn. If the student is having insufficient opportunity to learn, then the most obvious programmatic change is simply to increase the number of opportunities to learn.

7. **Codes.** The “Codes” section (Refer to G on Figure 1) on the TADS allows teachers space to note teaching and testing examples. These examples relate back to the annual goal in terms of whether generalized performance is desired or whether performance is restricted to selected examples (i.e., situations, locations, materials, or people). For example, if the annual goal is to purchase three items in any large grocery store, teachers, after completing a general case analyses of the activity, might choose to teach in Krogers, Whites, and Foodlion and to test for generalized performance in Winn Dixie and Reds grocery store. In the “Codes” section teachers may code these locations: A= Krogers, B= Whites, C= Foodlion, D= Winn Dixie, E= Reds.

8. **Location.** “Location” provides a spot on the TADS for teachers to record which specific teaching or testing example(s), as coded in the “Codes” section (Section G on Figure 1), is employed during instruction, the specific teaching or testing example(s) employed are noted in the “Location” section of the TADS. (Refer to section H on Figure 1).

9. **Raw Data** refer to the student performance on each step of the task or activity. Recording student performance is completed by the use of a scoring key (Refer to Section I marked “Data”, on Figure 1) and a place to record the raw data (Refer to J on Figure 1). Section J on Figure 1 is comprised of thirty columns. Each column, associated with a specific “date” (or session or trial), consists of numerals 0 through 20. The numerals refer to the steps in the activity or task or trials in the session. For example, numeral 1 refers to the first step in the task or activity, 2 to the second step, 3 to the third step, and so forth to the total number of steps in the task or activity. In recording student performance using the data code (See I on Figure 1), on any given date/trial/session and for each step in the task or activity, the teacher records a “/” if the student performs the steps correctly (if using a trial & error teaching strategy) or correctly with the identified prompt (if using an errorless learning teaching strategy). The teacher records an “X” if the student performs the step incorrectly (if using a trial & error teaching strategy), incorrectly with a prompt (if using an errorless learning strategy), or did not respond within 3 seconds. If the student is not allowed to make an error on a given step, a “P” is drawn through the numerical corresponding to the particular step on which the student was prompted prior to being allowed to make a response. The “/”, “X” and “P” is drawn through the numeral. After the student completes the activity or task with teaching assistance as noted in the teaching strategy section (Refer to Section E on Figure 1), the teacher counts up and circles the total number of steps the students performed correctly (if using a trial & error teaching strategy) or correctly with prompt (if using an errorless learning teaching strategy). Note that there is a zero (0) below each column of numerals. Teachers circle the “0” of the student performed no step correctly or correctly with a prompt. From day to day session to session, the circles are connected by a solid line. Nonconsecutive days or sessions are denoted by a dashed line between circles. Connected circles then form a visual display, or graph, or the student’s progress toward learning the task or activity over time.

Figure 2 is an example of a completed TADS for a student over a three week period. The student, Dominick, is learning to put on a sweatshirt. The natural cues include having a T-shirt or feeling cold. The natural consequences are Dominick feeling warm or cool. Training examples include the classroom simulation of morning routine (CS), after PE class (PE), and after work (CW). The teaching strategy used is trial & error with the standard error correction procedure within a global chaining format. This is noted at the top of the raw data section. On Tuesday, November 12, Dominick was sick. This is noted on the TADS above the November 12th date column. Thanksgiving break is similarly noted. On December 10th, the teacher provided a learning opportunity at the end of PE class but did not record the data. This is also noted at the top of the data section corresponding to December 10th.

Raw data on each step of the task analysis for each day is marked. For example, on November 20th, Dominick was provided a learning opportunity to put on his sweatshirt after work (CW). He correctly performed steps 1, 2, and 9. These are noted by a “/” mark through 1, 2, and 9. He made an error on step 10 as noted by an “X” through 10. He was not allowed to make an error, that is, he was prompted through steps 3-8. This is noted by “P” ‘s through 3, 4,5,6,7 and 8. Dominick correctly performed three steps of the task analysis as indicated by a circle drawn around the number 3. From day to day, the ‘circled total number of steps correctly performed’ is connected by a solid line. This results in a visual display, or graph, showing Dominick’s progress over time.

Programmatic changes occurred on November 19th and December 4th. The specific programmatic changes involved adding steps being systematically taught within the global chaining format. These changes are noted at the top of the data section. In addition, programmatic changes are noted by heavy solid lines, called “phase lines”, drawn vertically, between the last date before the programmatic change and the first day of the programmatic change. Note the phase lines on Figure 2. The ‘circled total number of steps correctly performed’ are NOT connected across phase lines. In addition, the ‘circled total number of steps correctly performed’ between nonconsecutive days of data are connected by dashed rather than solid lines. This can be seen on figure 2 on November 11th -13th and November 27th - December 2nd.

Upon reviewing the connected circles over time, one will note that Dominick is making steady progress toward his goal.
